

## Release 2.19 Notes

There are major changes to the code in this release, as it was re-built using the latest Version of Android Studio. For more information, please read the 2.19 Details Document.

- Parameters for ORIENTATION and FULL\_SCREEN have been discontinued. Instead, the application will automatically run in the device's default orientation, (typically portrait for Hand Helds and landscape for Tablets). The status bar will always be visible at the top of the screen.
- Fix for Camera Scanning on old Android devices, running Android 5 (Lollipop). In some cases the camera view would remain black.
- Popup Screens, (like the EXIT screen) now use a dedicated font
- Re-built to support 16KB pages. This is a new requirement from google and must be in place by November 2025.
- Added the ability to append a Function key to the end of a Scan by extending the SCAN\_PREFIX parameter. An optional Function key value can be added. Example: To send an F1 after the Scan set the value to SCAN\_PREFIX,126:1
- Added the ability to send function key presses F13-F24 by pressing SHIFT+F1 for F13, SHIFT+F2 for F14 ... etc.

## Release Notes, Prior Versions

- Earlier versions will not correctly render the screen on Android devices running version 16 or higher
- MAC based licensing will not work on Android devices running version 13 or higher.
